Practical Assignment Evaluation Criteria

Report (45 points)

- Clarity of text, structure, and spelling. **(10 points)**
- Understanding of the underlying theory **(20 points)**, including:
 - A conflict set for each problem, and a proof for one conflict set that it is a conflict set.
 - Explanation of the theorem prover function in terms of functional use, not a summary of the code.
- Embedding of the assignment in its scientific context; references to relevant literature. **(10 points)**
- Description of how the tasks were (evenly) divided among the three team members.¹ **(5 points)**

Code (45 points)

- Clarity of code. Semantically rich variable names, consistent order of arguments, well-organised set of functions, (high-level) documentation of the code, and so on. **(15 points)**
- `makeHittingTree` algorithm. **(20 points)**
- Gathering hitting sets from tree and checking for subset minimality. **(5 points)**
- Single algorithm, i.e. query should only call this function with a diagnostic problem as input and get diagnoses as output. **(5 points)**

Evaluation (10 points)

- Correctness assessment. Are there results and are they correct? **(10 points)**

Bonus Points (10 points)

- According to extra work performed, e.g., complexity analysis of the algorithm, conceptual limitations, possible improvements. **(10 points)**

¹If a name is added without a significant contribution to the project this is considered fraud by *all* team members. As covered in the instructions in the course manual, different group sizes are allowed only with explicit permission.
